Developing new and changing existing concepts related to climate change

Wednesday, 21 June 2023 16:45 (1h 30m)

Climate change and environmental degradation can have profound impacts on security and actors' conceptualisations of norms, identity, borders, citizenship and sovereignty. This panel explores how concepts change and are further developed in the face of major challenges such as climate change by using a variety of methods and theoretical approaches. Case studies include carbon disclosure, borders along rivers and lakes, regulating aviation, nuclear testing and broader security implications of climate change.
